Distance calculator planning:

I will do a post request with data parameters

Mandatory fields = distance1,distance2,requester_unit

http://127.0.0.1:8000/api/calculate_distance

params{
      "meters":2,
      "yards":3,
      "requester_unit":"meters"
      }
keys = units,requester
values = float distance

validations:
      only accept meters and yards as keys
      float values for distances
      string not null for requester unit.

 valid units {yards,meters}
